Playground

If You are interested in VB-Scripting
Read and try out: David Rutten Rhinoscript101.pdf with examples
*Look for more *.rvb in the internet.*

Permit
Start Grasshopper with command prompt: Type in «grasshopper» or click icon
Follow the instructions in the file «04_grids_976.gh»

*Adapt the routines to Your needs. Bake an own object and render **it with transparent background**. Save it as «yourlogin.png» and upload it.*

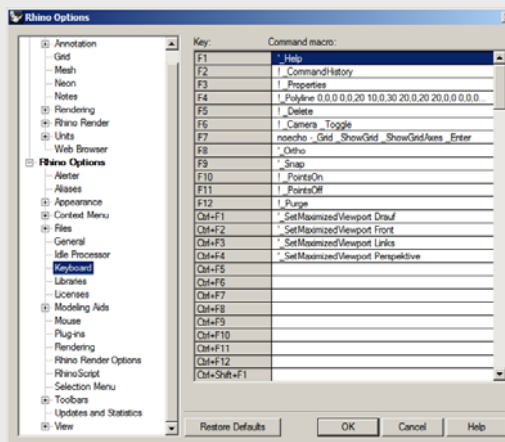

Macros: linear sequences of commands
 You will find a list of commands in the Help

Syntax

- ! (Exclamation Mark) Deleting the previous command
- _ (Underline) English command name
- (Hyphen) Suppresses Options Window
- ' (Apostrophe) Next command is nested
- ; (Semicolon) Comment

Tools – Read Command File: *.txt
 Or set a Shortcut in the Options -
 Keyboard - F4

Macros

«Parenting» is a one-way relationship:
The child depends of the parents, the parents not depend of the children.

Activate „**Record History**“ while using the (loft) command.
You now can modify the curves - the surface will follow.
When You move the surface, the relation will be broken.

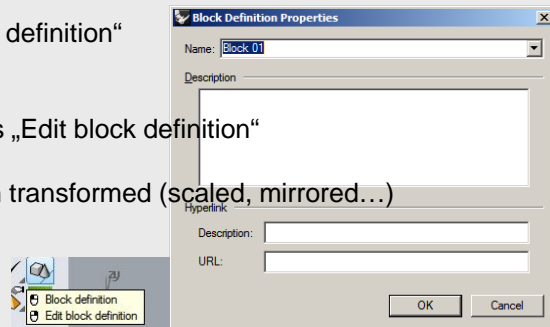

Consult F1(Help) „History“ to look which commands are „history – enabled“

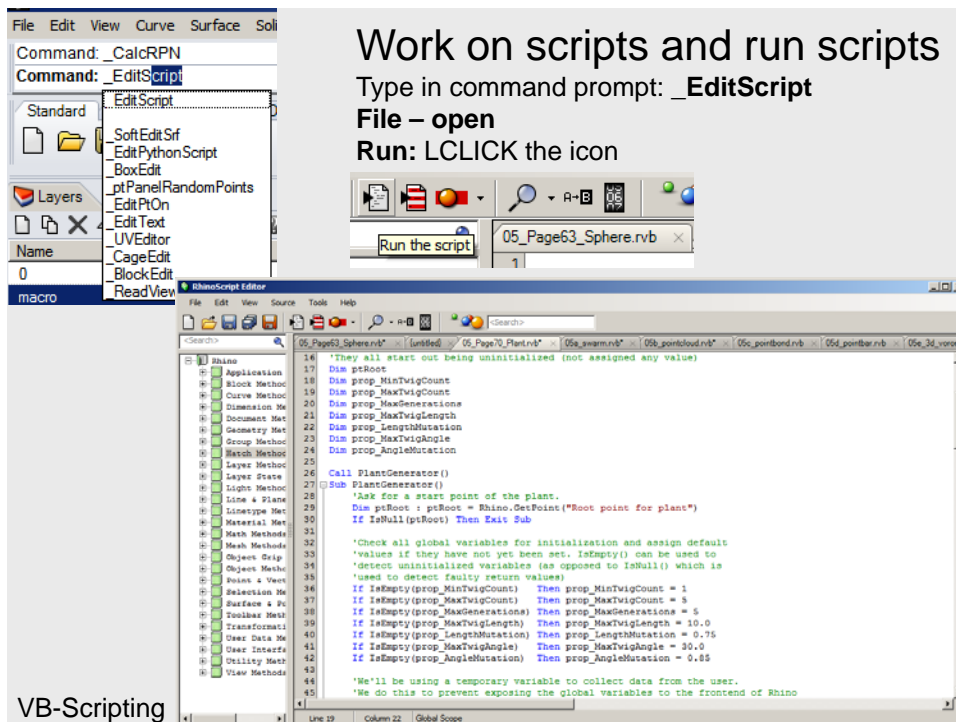

History

«Blocks» is a two-way relationship:

Select an object and press „Block definition“
Give a name
Copy the object several times.
Select one of the objects an press „Edit block definition“
Edit it and confirm:
All blocks are adapted even when transformed (scaled, mirrored...)

Blocks

VB-Scripting

RhinoScript

This language is situated between macros and compiled (translated in computer language) Programs

Rhinoscript is based on Microsoft Visual Basic Script (VBScript):

BASIC-Family in 3. Generation

(Beginners **All** purpose **Symbolic Instruction Code**, 1963)

And ist a

Object-oriented language (Opposite: Batch system, like macros)

The task of syntax is:

Handling variable data

Flow control

Input – output control

VB-Scripting: additional knowledge

Variables

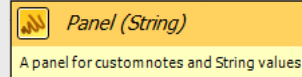

The common variables are:

integer - a real number

double - a decimal place number

booleans - either true or false

strings - a set of characters

Arrays are lists of variables.

They are retrieved with a zero-based counting system: the Index.

```
Dim arrExample(3)
```

```
arrExample(0) = 9
```

```
arrExample(1) = 11
```

```
arrExample(2) = 3
```

```
arrExample(3) = 7
```

VB-Scripting : additional knowledge
